Vitrualenv

Vitrualenv

Python Virtual Envs
Django 1.5
virtualenv1
Django 1.4
virtualenv2
Django 1.0
virtualenv3
.....
Python
Easy Install
PIP
Virtualenv
Virtualenvwrapper
Local Mac
ZIP
BASH
Python 2.7
.....
Python 3.3
GIT
SQL
Homebrew
.....
Django Projects
/usr/bin
/usr/local/bin

Vitrualenv

- pip install virtualenv
- pip3 install virtualenv
- easy_install virtualenv

- virtualenv
- virtualenv project

- WIN Scripts\activate.bat
- MAC
  - source ./bin/activate
  - Deactivate

```
(m_django) c:\GitHub\mandarinx_django\m_django>
```

Install Django

pip install django==1.11rc1

Install Django - Verifying

python -m django --version

```
(mywebsite) c:\GitHub\Django_new\mysite>python -m django --version
1.11rc1
```

Part 1: Requests and responses

Creating a project

- django-admin startproject mysite
- python manage.py runserver

```
mysite/
    manage.py
    mysite/
        __init__.py
        settings.py
        urls.py
        wsgi.py
```

Creating a project

- manage.py: A command-line utility that lets you interact with this Django project in various ways.
- mysite/__init__.py: An empty file that tells Python that this directory should be considered a Python package.
- mysite/settings.py: Settings/configuration for this Django project.
- mysite/urls.py: The URL declarations for this Django project.
- mysite/wsgi.py: An entry-point for WSGI-compatible web servers to serve your project.

Creating app

- What's the difference between a project and an app?
- An app is a Web application that does something – e.g., a Weblog system, a database of public records or a simple poll app.
- A project is a collection of configuration and apps for a particular website. A project can contain multiple apps. An app can be in multiple projects.

Creating app

- python manage.py startapp jerry

```
polls/
    __init__.py
    admin.py
    apps.py
    migrations/
        __init__.py
    models.py
    tests.py
    views.py
```

Write your first view

Write your first view

Write your first view

```
The `urlpatterns` list routes URLs to views. For more information please see:
    https://docs.djangoproject.com/en/dev/topics/http/urls/
Examples:
Function views
    1. Add an import:  from my_app import views
    2. Add a URL to urlpatterns:  url(r'^$', views.home, name='home')
Class-based views
    1. Add an import:  from other_app.views import Home
    2. Add a URL to urlpatterns:  url(r'^$', Home.as_view(), name='home')
Including another URLconf
    1. Import the include() function: from django.conf.urls import url, include
    2. Add a URL to urlpatterns:  url(r'^blog/', include('blog.urls'))
"""
from django.conf.urls import include, url
from django.contrib import admin

urlpatterns = [
    url(r'^polls/', include('polls.urls')),
    url(r'^admin/', admin.site.urls),
]
```

Part 2: Models and the admin site

國立臺灣科技大學 資訊管理系 講師 Jerry

Part 2: Models and the admin site

```
$ python manage.py migrate
```

- The migrate command looks at the INSTALLED_APPS setting and creates any necessary database tables according to the database settings in your mysite/settings.py file and the database migrations shipped with the app (we'll cover those later).

```

Playing with the API

- python manage.py shell
- **from** polls.models **import** Question, Choice
- Question.objects.all()
- **from** django.utils **import** timezone
- q = Question(question_text="What's new?", pub_date=timezone.now())
- q.save()
- q.id
- q.question_text
- q.pub_date

Playing with the API

- q.question_text = "What's up?“
- q.save()
- Question.objects.all()

```
>>> Question.objects.all()
<QuerySet [<Question: Question object>]>
>>>
```

Playing with the API

```
from django.db import models

# Create your models here.
class Question(models.Model):
    question_text = models.CharField(max_length=200)
    pub_date = models.DateTimeField('date published')

    def __str__(self):
        return self.question_text

class Choice(models.Model):
    question = models.ForeignKey(Question, on_delete=models.CASCADE)
    choice_text = models.CharField(max_length=200)
    votes = models.IntegerField(default=0)

    def __str__(self):
        return self.choice_text
```

Playing with the API

- python manage.py makemigrations polls
- python manage.py migrate
- python manage.py shell

- **from** polls.models **import** Question, Choice
- Question.objects.all()

```
>>> from polls.models import Question, Choice
>>> Question.objects.all()
<QuerySet [<Question: What's up>]>
```

Creating an admin user

- python manage.py createsuperuser
- Username: admin
- Email address: admin@example.com
- Password: &1234567
- python manage.py runserver

Part 3: Views and templates

國立臺灣科技大學 資訊管理系 講師 Jerry

Functions

- Question “index” page – displays the latest few questions.
- Question “detail” page – displays a question text, with no results but with a form to vote.
- Question “results” page – displays results for a particular question.
- Vote action – handles voting for a particular choice in a particular question.

polls/urls.py

views.py urls.py

```
from django.conf.urls import url

from . import views

urlpatterns = [
    # ex: /polls/
    url(r'^$', views.index, name='index'),
    # ex: /polls/5/
    url(r'^(?P<question_id>[0-9]+)/$', views.detail, name='detail'),
    # ex: /polls/5/results/
    url(r'^(?P<question_id>[0-9]+)/results/$', views.results, name='results'),
    # ex: /polls/5/vote/
    url(r'^(?P<question_id>[0-9]+)/vote/$', views.vote, name='vote'),
]
```

^ 表示開始

$ 表示結束

+ 表示前面的元素至少重複一次

() 用表示一部分模式

?P代表匹配某個模式

```
from django.db import models

# Create your models here.
class Question(models.Model):
    question_text = models.CharField(max_length=200)
    pub_date = models.DateTimeField('date published')

    url(r'^(?P<question_id>[0-9]+)/results/$', views.results, name='results'),
AttributeError: module 'polls.views' has no attribute 'results'
```

```python
from django.conf.urls import url

from . import views

urlpatterns = [
    url(r'^$', views.index, name='index'),
    url(r'^(?P<question_id>[0-9]+)/$', views.detail, name='detail'),
    url(r'^(?P<question_id>[0-9]+)/results/$', views.results, name='results'),
    url(r'^(?P<question_id>[0-9]+)/vote/$', views.vote, name='vote'),
]
```

http://127.0.0.1:8000/polls/22/

127.0.0.1:8000/polls/22/

You're looking at question 22.

```python
from django.conf.urls import url

from . import views

urlpatterns = [
    url(r'^$', views.index, name='index'),
    url(r'^(?P<question_id>[0-9]+)/$', views.detail, name='detail'),
    url(r'^(?P<question_id>[0-9]+)/results/$', views.results, name='results')
    url(r'^(?P<question_id>[0-9]+)/vote/$', views.vote, name='vote'),
]
```

http://127.0.0.1:8000/polls/1/results/

127.0.0.1:8000/polls/1/results/

You're looking at the results of question 1.

```python
from django.conf.urls import url

from . import views

urlpatterns = [
    url(r'^$', views.index, name='index'),
    url(r'^(?P<question_id>[0-9]+)/$', views.detail, name='detail'),
    url(r'^(?P<question_id>[0-9]+)/results/$', views.results, name='results'),
    url(r'^(?P<question_id>[0-9]+)/vote/$', views.vote, name='vote'),
]
```

http://127.0.0.1:8000/polls/1/results/

127.0.0.1:8000/polls/1/vote/

You're voting on question 1.

Write views that actually do something

- Each view is responsible for doing one of two things: returning an HttpResponse object containing the content for the requested page, or raising an exception such as Http404.

polls/views.py

```python
from django.http import HttpResponse

# Create your views here.
from .models import Question

def index(request):
    return HttpResponse("Hello!")

def detail(request, question_id):
    return HttpResponse("You're looking at question %s." % question_id)

def results(request, question_id):
    response = "You're looking at the results of question %s."
    return HttpResponse(response % question_id)

def vote(request, question_id):
    return HttpResponse("You're voting on question %s." % question_id)

def index(request):
    latest_question_list = Question.objects.order_by('-pub_date')[:5]

```

A shortcut: get_object_or_404()

```
views.py
from django.http import HttpResponse
from django.template import loader
from django.shortcuts import get_object_or_404, render
from django.http import Http404

# Create your views here.
from .models import Question
```

Page not found (404)

Request Method: GET
Request URL: http://127.0.0.1:8000/polls/11/
Raised by: polls.views.detail

No Question matches the given query.

You're seeing this error because you have `DEBUG = True` in your Django settings file. Change that to `False`, and Django will display a standard 404 page.

```
def index(request):
    latest_question_list = Question.objects.order_by('-pub_date')[:5]
    context = {'latest_question_list': latest_question_list}
    return render(request, 'polls/index.html', context)

def detail(request, question_id):
    question = get_object_or_404(Question, pk=question_id)
    return render(request, 'polls/detail.html', {'question': question})
```

務必記得加上detail.html

polls/templates/polls/detail.html

```
{{ question }}
```

2 <h1>{{ question.question_text }}</h1>
3
```

Namespacing URL names

- How does one make it so that Django knows which app view to create for a url when using the {% url %} template tag? (方便識別自己用的APP)

polls/urls.py

```
from django.conf.urls import url

from . import views

app_name = 'polls'
urlpatterns = [
    url(r'^$', views.index, name='index'),
    url(r'^(?P<question_id>[0-9]+)/$', views.detail, name='detail'),
    url(r'^(?P<question_id>[0-9]+)/results/$', views.results, name='results'),
    url(r'^(?P<question_id>[0-9]+)/vote/$', views.vote, name='vote'),
]
```

polls/templates/polls/index.html

```
<li><a href="{% url 'polls:detail' question.id %}">{{ question.question_text }}</a></li>
```

Part 4: Forms and generic views

國立臺灣科技大學 資訊管理系 講師 Jerry

HTML Forms

- **action** :The **action** attribute defines the action to be performed when the form is submitted.
  Normally, the form data is sent to a web page on the server when the user clicks on the submit button.

```
<h1>{{ question.question_text }}</h1>

{% if error_message %}<p><strong>{{ error_message }}</strong></p>{% endif %}

<form action="{% url 'polls:vote' question.id %}" method="post">
{% csrf_token %}
{% for choice in question.choice_set.all %}
    <input type="radio" name="choice" id="choice{{ forloop.counter }}" value="{{ choice.id }}" />
    <label for="choice{{ forloop.counter }}">{{ choice.choice_text }}</label><br />
{% endfor %}
<input type="submit" value="Vote" />
</form>
```

HTML Forms

- The **method** attribute specifies the HTTP method (**GET** or **POST**) to be used when submitting the form data

```
<h1>{{ question.question_text }}</h1>

{% if error_message %}<p><strong>{{ error_message }}</strong></p>{% endif %}

<form action="{% url 'polls:vote' question.id %}" method="post">
{% csrf_token %}
{% for choice in question.choice_set.all %}
    <input type="radio" name="choice" id="choice{{ forloop.counter }}" value="{{ choice.id }}" />
    <label for="choice{{ forloop.counter }}">{{ choice.choice_text }}</label><br />
{% endfor %}
<input type="submit" value="Vote" />
</form>
```

Using GET

http://www.somedomain.com/register.asp?name=jobe&email=jobe@electrotank.com

Using POST

http://www.somedomain.com/register.asp

HTML Forms

- **<input type="radio">** defines a **radio button**.
- Radio buttons let a user select ONLY ONE of a limited number of choices:

```
<h1>{{ question.question_text }}</h1>

{% if error_message %}<p><strong>{{ error_message }}</strong></p>{% endif %}

<form action="{% url 'polls:vote' question.id %}" method="post">
{% csrf_token %}
{% for choice in question.choice_set.all %}
    <input type="radio" name="choice" id="choice{{ forloop.counter }}" value="{{ choice.id }}" />
    <label for="choice{{ forloop.counter }}">{{ choice.choice_text }}</label><br />
{% endfor %}
<input type="submit" value="Vote" />
</form>
```

```
<!DOCTYPE html>
<html>
<body>

<form action="/action_page.php">
  <input type="radio" name="gender" value="male"> Male<br>
  <input type="radio" name="gender" value="female"> Female<br>
  <input type="radio" name="gender" value="other"> Other<br><br>
  <input type="submit">
</form>
```

Male

提交

```python
from django.http import HttpResponseRedirect, HttpResponse
from django.template import loader
from django.shortcuts import get_object_or_404, render
from django.http import Http404
from django.urls import reverse
```

```python
def vote(request, question_id):
    question = get_object_or_404(Question, pk=question_id)
    try:
        selected_choice = question.choice_set.get(pk=request.POST['choice'])
    except (KeyError, Choice.DoesNotExist):
        # Redisplay the question voting form.
        return render(request, 'polls/detail.html', {
            'question': question,
            'error_message': "You didn't select a choice.",
        })
    else:
        selected_choice.votes += 1
        selected_choice.save()
        # Always return an HttpResponseRedirect after successfully dealing
        # with POST data. This prevents data from being posted twice if a
        # user hits the Back button.
        return HttpResponseRedirect(reverse('polls:results', args=(question.id,)))
```
